**[DESCRIPTION]**

## FIELD OF THE INVENTION

5

The present invention relates to an improved ink jet recording material.

## BACKGROUND OF THE INVENTION

10

In the majority of applications printing proceeds by pressure contact of an ink-loaded printing form with an ink-receiving material which is usually plain paper. The most frequently used impact printing technique is known as lithographic printing based on the selective acceptance of oleophilic ink on a suitable receptor. In recent times however so-called non-impact printing systems have replaced classical pressure-contact printing to some extent for specific applications. A survey is given e.g. in the book "Principles of Non Impact Printing" by Jerome L. Johnson (1986), Palatino Press, Irvine, CA 92715, USA.

20

Among non-impact printing techniques ink jet printing has become a popular technique because of its simplicity, convenience and low cost. Especially in those instances where a limited edition of the printed matter is needed ink jet printing has become a technology of choice. A recent survey on progress and trends in ink jet printing technology is given by Hue P. Le in *Journal of Imaging Science and Technology* Vol. 42 (1), Jan/Febr 1998.

25

In ink jet printing tiny drops of ink fluid are projected directly onto an ink receptor surface without physical contact between the printing device and the receptor. The printing device stores the printing data electronically and controls a mechanism for ejecting the drops image-wise. Printing is accomplished by moving the print head across the paper or vice versa. Early patents on ink jet printers include US 3,739,393, US 3,805,273 and US 3,891,121.

30

The jetting of the ink droplets can be performed in several different ways. In a first type of process a continuous droplet

35

- 3 -

stream is created by applying a pressure wave pattern. This process is known as continuous ink jet printing. In a first embodiment the droplet stream is divided into droplets that are electrostatically charged, deflected and recollected, and into droplets that remain  
5 uncharged, continue their way undeflected, and form the image.

Alternatively, the charged deflected stream forms the image and the uncharged undeflected jet is recollected. In this variant of continuous ink jet printing several jets are deflected to a different degree and thus record the image (multideflection system).

10 According to a second process the ink droplets can be created "on demand" ("DOD" or "drop on demand" method) whereby the printing device ejects the droplets only when they are used in imaging on a receiver thereby avoiding the complexity of drop charging, deflection hardware, and ink recollection. In drop-on-demand the ink  
15 droplet can be formed by means of a pressure wave created by a mechanical motion of a piezoelectric transducer (so-called "piezo method"), or by means of discrete thermal pushes (so-called "bubble jet" method, or "thermal jet" method).

Ink compositions for ink jet typically include following ingredients  
20 : dyes or pigments, water and/or organic solvents, humectants such as glycols, detergents, thickeners, polymeric binders, preservatives, etc.. It will be readily understood that the optimal composition of such an ink is dependent on the ink jetting method used and on the nature of the substrate to be printed. The ink  
25 compositions can be roughly divided in :

- water based ; the drying mechanism involves absorption, penetration and evaporation;
- oil based ; the drying involves absorption and penetration;
- solvent based ; the drying mechanism involves primarily  
30 evaporation;
- hot melt or phase change : the ink vehicle is liquid at the ejection temperature but solid at room temperature ; drying is replaced by solidification;
- UV-curable ; drying is replaced by polymerization.

35 It is known that the ink-receiving layers in ink-jet recording materials must meet different stringent requirements :

- 4 -

- The ink-receiving layer should have a high ink absorbing capacity, so that the dots will not flow out and will not be expanded more than is necessary to obtain a high optical density.

5 - The ink-receiving layer should have a high ink absorbing speed (short ink drying time) so that the ink droplets will not feather if smeared immediately after applying.

- The ink dots that are applied to the ink-receiving layer should be substantially round in shape and smooth at their peripheries. The dot diameter must be constant and accurately controlled.

10 - The receiving layer must be readily wetted so that there is no "puddling", i.e. coalescence of adjacent ink dots, and an earlier absorbed ink drop should not show any "bleeding", i.e. overlap with neighbouring or later placed dots.

15 - Transparent ink-jet recording elements must have a low haze-value and be excellent in transmittance properties.

- After being printed the image must have a good resistance regarding water-fastness, light-fastness, and good endurance under severe conditions of temperature and humidity.

20 - The ink jet recording element may not show any curl or sticky behaviour if stacked before or after being printed.

- The ink jet recording element must be able to move smoothly through different types of printers.

All these properties are often in a relation of trade-off. It is difficult to satisfy them all at the same time.

25

In order to obtain images showing high gloss, high color densities and fast drying it is desirable that the ink receiving layer has a relative high coating weight and a high pigment/binder ratio.

30 However, such a high pigment/binder ratio tends to deteriorate the mechanical strength of the ink receiving layer, in particular when a flexible support is used, which is often visible as microcracks. It is strongly desired to find measures to avoid this cracking while retaining the other good image properties.

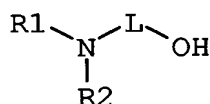

35 SUMMARY OF THE INVENTION

- 5 -

It is the object of the present invention to provide an ink jet receiving medium wherein the finished image shows high gloss and high densities in the absence of cracking.

The above-mentioned advantageous effects are realised by providing an ink jet recording material comprising a support and at least one ink receiving layer containing a water-soluble or water-dispersible polymer, characterized in that said polymer comprises a repeating monomeric unit having a moiety capable of chelating boric acid by means of at least one nitrogen containing functional group and at least one hydroxyl group thereby forming a five- or six-membered ring.

A preferred class of monomers is represented by following general formula (I):

(I)

wherein,

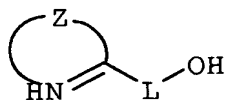

R1 and R2 are selected from the group consisting of hydrogen, a substituted or unsubstituted, saturated or unsaturated aliphatic group, a substituted or unsubstituted aryl group, and a substituted or unsubstituted heteroaryl group;

L represents a linking group containing two or three carbon atoms which may be further substituted or may be part of a ring;

any of L, R1 and R2 may combine to form a ring, and

at least one of L, R1 and R2 comprises an ethylenically unsaturated polymerizable group.

Another preferred class of monomers is represented by following general formula (II) :

(II)

wherein,

- 6 -

Z represents the necessary atoms to form a substituted or unsubstituted five- or six-membered heteroring;

L represents a linking group containing one or two carbon atoms which may be further substituted or may be part of a ring, and  
5 at least one of the heteroring or L comprises an ethylenically unsaturated polymerizable group.

Further advantages and embodiments of the present invention will become apparent from the following description.

10

#### DETAILED DESCRIPTION OF THE INVENTION

The different layers and particular ingredients of the ink recording medium according to the present invention will now be explained in  
15 detail.

#### - the support

The support for use in the present invention can be chosen from  
20 paper type and polymeric type supports well-known from photographic technology. Paper types include plain paper, cast coated paper, polyethylene coated paper and polypropylene coated paper. Polymeric supports include cellulose acetate propionate or cellulose acetate butyrate, polyesters such as polyethylene terephthalate and  
25 polyethylene naphthalate, polyamides, polycarbonates, polyimides, polyolefins, poly(vinylacetals), polyvinyl chloride, polyethers and polysulfonamides. Other examples of useful high-quality polymeric supports for the present invention include opaque white polyesters and extrusion blends of polyethylene terephthalate and  
30 polypropylene. Polyester film supports and especially polyethylene terephthalate are preferred because of their excellent properties of dimensional stability. When such a polyester is used as the support material, a subbing layer may be employed to improve the bonding of the ink-receiving layer to the support. Useful subbing layers for  
35 this purpose are well known in the photographic art and include, for example, polymers of vinylidene chloride such as vinylidene chloride

- 7 -

/acrylonitrile /acrylic acid terpolymers or vinylidene chloride  
/methyl acrylate /itaconic acid terpolymers.

**- the ink receiving layer**

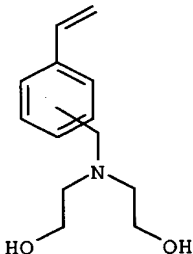

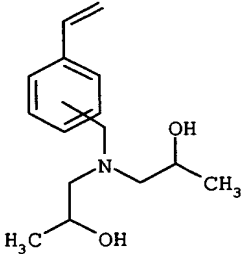

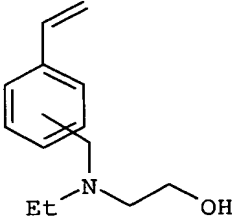

5

It is the gist of the present invention that the ink receiving layer contains a polymer comprising a repeating monomeric unit having a moiety capable of chelating boric acid by means of at least one nitrogen containing functional group and at least one hydroxyl group  
10 thereby forming a five- or six-membered ring. Preferred monomers are represented by general formula (I) or general formula (II) explained above.

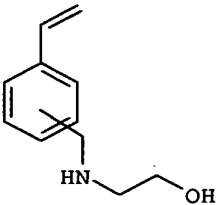

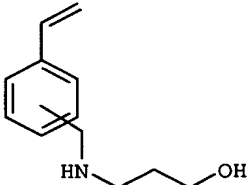

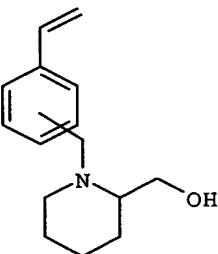

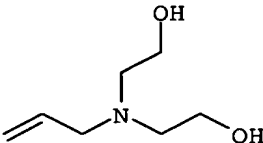

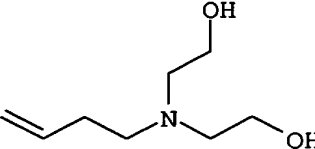

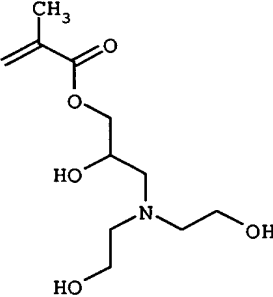

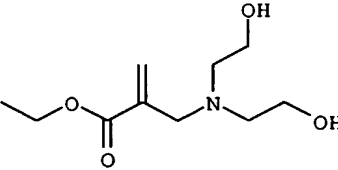

Illustrative for general formula (I) are following monomers (table 1):

#### Preparation of monomers :

Some of the monomers of tables 1 and 2, usable for polymer synthesis  
 5 in connection with the present invention are known, e.g. compound I  
 - 1, others may be not known but can be prepared according to known  
 preparation paths.

Some examples of the preparation of monomers are given hereinafter.  
The synthesis of monomer I - 1 :

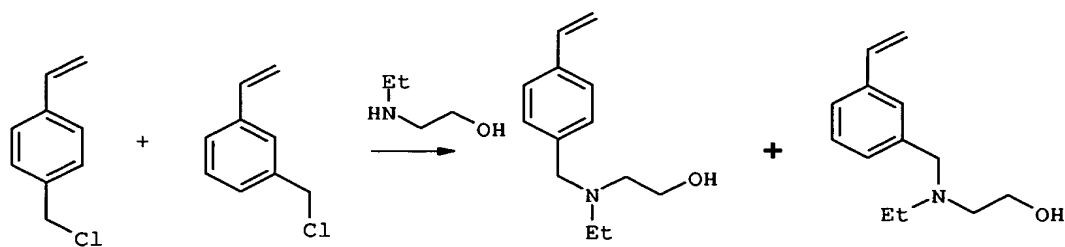

- 12 -

A mixture of 185 g (1.21 mol) of chloromethylstyrene (a mixture of the 3- and the 4-isomer), 636 g (6 mol) of diethanolamine and 2.6 g  
 5 of 2,6-di-tert. butyl-4-methylphenol as polymerization inhibitor was heated to 90°C. The reaction was allowed to continue for 2 hours at 90°C. After cooling down to room temperature, 400 ml of methylene chloride was added. The mixture was first extracted with 400 ml of water and then twice with 100 ml of water. The pooled aqueous  
 10 fractions were extracted twice with 150 ml of methylene chloride. The pooled organic fractions were dried over Na<sub>2</sub>SO<sub>4</sub> and evaporated under reduced pressure. 252 g (99%) of monomer I - 1 was isolated as a mixture of a 3- and a 4-isomer. The compound could be used for polymerization without further purification.

15

The synthesis of monomer I - 3 :

20 26.75 g (0.3 mol) of hydroxyethyl-ethylamine, 0.59 g (4.8 mmol) of 4-methoxyphenol and 0.24 g (1.6 mmol) of sodium iodide were dissolved in 150 ml of acetonitrile. A solution of 18.3 g (0.12 mol) of chloromethylstyrene (a mixture of the 3- and 4-isomer) in 30 ml of acetonitrile was added and the reaction mixture was refluxed for  
 25 2 hours. After cooling down to room temperature, the solvent was

- 13 -

evaporated under reduced pressure and the residue was redissolved in 150 ml of methylene chloride. The methylene chloride solution was extracted with 200 ml of water. The aqueous layer was extracted three times with 100 ml of methylene chloride. The pooled methylene  
5 chloride fractions were dried over  $\text{Na}_2\text{SO}_4$ . The solvent was removed under reduced pressure and monomer I - 3 was isolated by preparative column chromatography (eluent :  $\text{CH}_2\text{Cl}_2/\text{MeOH}$  90/10 on Kromasil 60A 10  $\mu\text{m}$ ). 17.2 g (yield 70%) of monomer I - 3 was isolated as an oily compound.

10

For the preparation of the polymer in connection with the present invention the repeating monomeric unit defined above and having a moiety capable of chelating boric acid is preferably copolymerized with at least one other known conventional monomer.  
15 For example, this monomer can be chosen from: acrylic monomers, e.g. ethyl acrylate, butyl methacrylate, 2-ethylhexylacrylate, ethyl methacrylate, butyl acrylate, glycidylmethacrylate, hydroxyethyl acrylate, hydroxyethyl methacrylate, methyl acrylate, methyl methacrylate, 2-methoxyethyl acrylate, butyl diglycol methacrylate,  
20 trifluoroethyl methacrylate, 2-ethyl perfluoro alkyl acrylate, isooctyl acrylate, lauryl acrylate, stearyl methacrylate, lauryl methacrylate, isobornyl acrylate, dicyclopentenylloxyethyl methacrylate, t-butylaminoethyl methacrylate, 2-methoxyethyl acrylate, benzyl acrylate, 4-hydroxybutyl acrylate,  
25 acryloxyethyltrimethyl ammonium chloride, dimethylaminoethyl acrylate, dimethylamino ethyl methacrylate, dimethylamino propyl methacrylate, dimethyl amino ethyl methacrylamide, dimethylamino propyl methacrylamide, methacryloxyethyl trimethyl ammonium chloride, diethylene glycol methacrylate, diethylene glycol  
30 acrylate, dipropylene glycol methacrylate, 2-acetoacetoxyethyl methacrylate, 2-acetoacetoxyethyl acrylate, vinyltrimethoxysilane, pentaerythritol acrylate, methacyloxy propyl trimethoxy silane, tert. butyl methacrylate, acryloxyethyldimethyl benzyl ammonium chloride, benzyl methacrylate, methacrylate terminated polyethers,  
35 cyclohexyl methacrylate, glycerol monomethacrylate, glycidyl acrylate, n-hexyl acrylate, tetraethyleneglycol dimethacrylate and

- 14 -

allylmethacrylate; vinyl esters, e.g. vinyl versatate, triethylene glycol divinyl ether tripropylene glycol diacrylate, vinyl acetate, vinyl terminated poly(ethylene oxide), allyl terminated poly(ethylene oxide), neopentyl vinyl ether; and other monomers e.g. vinyl alcohol, vinyl amine, vinylacetamide, allylamine, vinyl imidazole, vinyl pyrrolidone, diallyl amine, diallyl dimethylammonium chloride, methacryloyl ethyl trimethylammonium chloride, methacryloyl propyl trimethylammonium chloride, butadiene, isoprene, ethylene, diacetone acrylamide, 2-acrylamido-2-methyl-1-propanesulfonic acid, acrylic acid, methacrylic acid, styrene, acrylamide, acrylonitrile, diethyl maleate, dibutyl maleate, 4-vinylpyridine, 2-vinyl pyridine, methacrylonitrile, N-methylol acrylamide, and vinyl formamide.

Examples of the synthesis of such copolymers are described in the examples section hereinafter.

Preferably the polymer used in accordance with the present invention is a water-dispersible polymeric latex. When the polymer is water-soluble or a film-forming latex it can be advantageously used as binder for the ink receiving layer.

The particular advantage of using such a polymer as binder in an ink receiving layer can be explained as follows. One way for assuring a good ink uptake is a sufficient porosity of the layer. This can be realized by means of a high ratio of amount of pigment (e.g. silica, alumina) versus binder (e.g. polyvinyl alcohol). However, such a high pigment/binder ratio tends to deteriorate the mechanical strength of the layer resulting in the occurrence of cracks and curling. Contrary to conventional binders the polymers used in the present invention are able to crosslink between the pigment and the hardener, which is preferably boric acid since the polymer binder is defined as having a chelating property for this hardener. Very efficient crosslinking is obtained. As a result it is possible to use relative high amounts of polymer binder (up to 20% versus 80% of pigment) resulting in good mechanical cohesion and absence of cracking and curling while retaining sufficient porosity.

- 15 -

When the latex is not filmforming it can serve as pigment. In microporous layers often silica or alumina is used as pigment to create porosity. In the same way a non-filmforming latex can be used  
5 as particle to create porosity. Furthermore, when a latex is not film forming the particle surface stays intact and can offer surfaces inside the coating. In a heterogenous system comprising a non-filmforming latex the surface of the latex can interact for example with the dyes from the ink. In this case, or when for some  
10 reason an extra second binder is desired this can be chosen from the compounds well-known in the art of ink jet recording. Useful binders include hydroxyethyl cellulose; hydroxypropyl cellulose; hydroxyethylmethyl cellulose; hydroxypropyl methyl cellulose; hydroxybutylmethyl cellulose; methyl cellulose; sodium carboxymethyl  
15 cellulose; sodium carboxymethylhydroxyethyl cellulose; water soluble ethylhydroxyethyl cellulose; cellulose sulfate; polyvinyl alcohol; vinylalcohol copolymers; polyvinyl acetate; polyvinyl acetal; polyvinyl pyrrolidone; polyacrylamide; acrylamide/acrylic acid copolymer; polystyrene, styrene copolymers; acrylic or methacrylic  
20 polymers; styrene/acrylic copolymers; ethylene-vinylacetate copolymer; vinylmethyl ether/maleic acid copolymer; poly(2-acrylamido-2-methyl propane sulfonic acid); poly(diethylene triamine-co-adipic acid); polyvinyl pyridine; polyvinyl imidazole; polyethylene imine epichlorohydrin modified; polyethylene imine  
25 ethoxylated; polyethylene oxide; polyurethane; melamine resins; gelatin; carrageenan; dextran; gum arabic; casein; pectin; albumin; starch; collagen derivatives; collodion and agar-agar.

The ink receiving layer in this invention is preferably a porous  
30 layer and therefore preferably contains a pigment. Preferably an inorganic pigment is used, which can be chosen from neutral, anionic and cationic pigment types. Useful pigments include e.g. silica, talc, clay, hydrotalcite, kaolin, diatomaceous earth, calcium carbonate, magnesium carbonate, basic magnesium carbonate,  
35 aluminosilicate, aluminum trihydroxide, aluminum oxide (alumina), titanium oxide, zinc oxide, barium sulfate, calcium sulfate, zinc

- 16 -

sulfide, satin white, alumina hydrate such as boehmite, pseudo boehmite, aluminum oxide, zirconium oxide or mixed oxides. Preferably, the pigment is a cationic type pigment selected from alumina hydrates, aluminum oxides, aluminum hydroxides, aluminum  
5 silicates, and cationically modified silicas.

A preferred type of alumina hydrate is crystalline boehmite, or  $\gamma$ - $\text{AlO}(\text{OH})$ . Useful types of boehmite include, in powder form, DISPERAL, DISPERAL HP14 and DISPERAL 40 from Sasol, MARTOXIN VPP2000-2 and GL-3 from Martinswerk GmbH.; liquid boehmite alumina systems, e.g.  
10 DISPAL 23N4-20, DISPAL 14N-25, DISPERAL AL25 from Sasol, boehmite dispersions BACASOL 2C and BACASOL 3C from Alcan. Patents on alumina hydrate include EP 500021, EP 634286, US 5,624,428, EP 742108, US 6,238,047, EP 622244, EP 810101, etc..

Useful cationic aluminum oxide (alumina) types include  $\alpha$ - $\text{Al}_2\text{O}_3$  types, such as NORTON E700, available from Saint-Gobain Ceramics & Plastics, Inc, and  $\gamma$ - $\text{Al}_2\text{O}_3$  types, such as ALUMINUM OXID C from Degussa; other aluminum oxide grades, such as BAIKALOX CR15 and CR30 from Baikowski Chemie; DURALOX grades and MEDIALOX grades from Baikowski Chemie, BAIKALOX CR80, CR140, CR125, B105CR from Baikowski  
20 Chemie; CAB-O-SPERSE PG003 trademark from Cabot, CATALOX GRADES and CATAPAL GRADES from from Sasol, such as PLURALOX HP14/150; colloidal  $\text{Al}_2\text{O}_3$  types, such as ALUMINASOL 100; ALUMINASOL 200, ALUMINASOL 220, ALUMINASOL 300, and ALUMINASOL 520 trademarks from Nissan Chemical Industries or NALCO 8676 trademark from ONDEO Nalco.

25 Other useful cationic inorganic pigments include aluminum trihydroxides such as Bayerite, or  $\alpha$ - $\text{Al}(\text{OH})_3$ , such as PLURAL BT, available from Sasol, and Gibbsite, or  $\gamma$ - $\text{Al}(\text{OH})_3$ , such as MARTINAL grades from Martinswerk GmbH, MARTIFIN grades, such as MARTIFIN OL104, MARTIFIN OL 107 and MARTIFIN OL111 from Martinswerk GmbH ,  
30 MICRAL grades, such as MICRAL 1440, MICRAL 1500; MICRAL 632; MICRAL 855; MICRAL 916; MICRAL 932; MICRAL 932CM; MICRAL 9400 from JM Huber company; HIGILITE grades, e.g. HIGILITE H42 or HIGILITE H43M from

- 17 -

Showa Denka K.K., HYDRAL COATES grades from Alcoa Co., such as HYDRAL COAT 2, 5, and 7; HYDRAL PGA and HYDRAL 710.

Another useful type of cationic pigment is zirconium oxide such as NALCO OOSS008 trademark of ONDEO Nalco, acetate stabilized  $ZrO_2$ ,  
5 ZR20/20, ZR50/20, ZR100/20 and ZRYS4 trademarks from Nyacol Nano Technologies.

Useful mixed oxides are SIRAL grades from Sasol, colloidal metal oxides from Nalco such as Nalco 1056, Nalco TX10496, Nalco TX11678.

Another preferred type of inorganic pigment is silica which can be  
10 used as such in its anionic form or after cationic modification.

Silica as pigment in ink receiving elements is disclosed in numerous old and recent patents, e.g. US 4,892,591, US 4,902,568, EP 373573, EP 423829, EP 487350, EP 493100, EP 514633, etc.. The silica can be chosen from different types, such as crystalline silica, amorphous  
15 silica, precipitated silica, fumed silica, silica gel, spherical and non-spherical silica. The silica may contain minor amounts of metal oxides from the group Al, Zr, Ti. Useful types include AEROSIL OX50 (BET surface area  $50 \pm 15 \text{ m}^2/\text{g}$ , average primary particle size 40 nm,

$SiO_2$  content  $> 99.8\%$ ,  $Al_2O_3$  content  $< 0.08\%$ ), AEROSIL MOX170 (BET

20 surface area  $170 \text{ g/m}^2$ , average primary particle size 15 nm,  $SiO_2$

content  $> 98.3\%$ ,  $Al_2O_3$  content 0.3-1.3%), AEROSIL MOX80 (BET surface area  $80 \pm 20 \text{ g/m}^2$ , average primary particle size 30 nm,  $SiO_2$  content  
> 98.3%,  $Al_2O_3$  content 0.3-1.3%), or other hydrophilic AEROSIL

grades available from Degussa-Hüls AG, which may give aqueous  
25 dispersions with a small average particle size ( $< 500 \text{ nm}$ ).

Cationically modified silica can be prepared by following methods, without meaning to be limitative :

(1) subjecting silica to a surface treatment with an inorganic cationic compound such as particular metal oxides and oxyhydroxides,  
30 e.g. aluminum oxides, and alumina hydrates such as boehmite and pseudo-boehmite; a useful cationic inorganic compound to modify silica is pseudo-boehmite. Pseudo-boehmite is also called boehmite gel and is fine particulate alumina hydrate having a needle form.

- 18 -

The composition thereof is generally represented by  $\text{Al}_2\text{O}_3 \cdot 1.5-2$

$\text{H}_2\text{O}$  and differs from that of crystalline boehmite;

(2) by subjecting silica to a surface treatment with an organic compound having both an amino group or quaternary ammonium group thereof or a quaternary phosphonium group, and a functional group having reactivity to a silanol group on the surface of silica, such as aminoalkoxysilane or aminoalkyl glycidyl ether or isopropanol amine;

(3) by polymerisation of a cationic or amino functional monomer in the presence of a silica.

In an alternative embodiment the pigment may be chosen from organic particles such as polystyrene, polymethyl methacrylate, silicones, melamine-formaldehyde condensation polymers, urea-formaldehyde condensation polymers, polyesters and polyamides. Mixtures of inorganic and organic pigments can be used. However, most preferably the pigment is an inorganic pigment.

The pigment must be present in a sufficient coverage in order to render the ink receiving layer sufficiently porous.

For obtaining glossy ink receiving layers the particle size of the pigment should preferably be smaller than 500 nm. In order to obtain a porous glossy layer which can serve as an ink receiving layer for fast ink uptake the pigment/binder ratio should be at least 4. Only at these high ratios the binder is no longer able to fill up all pores and voids created by the pigments in the coating. To achieve a sufficient porosity of the coating for fast ink uptake the pore volume of these highly pigmented coatings should be higher than 0.1 ml/g of coated solids. This pore volume can be measured by gas adsorption (nitrogen) or by mercury diffusion.

The ink receiving layer may be just a single layer but, alternatively, it may be composed of a double layer or even of a multiple layer assemblage. In the latter cases the polymeric binder and/or the pigment may be present in one of the layers, or in several of the layers or in all layers.

- 19 -

Apart from the essential ingredients described above a cationic substance acting as mordant may be present in the ink receiving layer. Such substances increase the capacity of the layer for fixing  
5 and holding the dye of the ink droplets. A particularly suited compound is a poly(diallyldimethylammonium chloride) or, in short, a poly(DADMAC). These compounds are commercially available from several companies, e.g. Aldrich, Nalco, CIBA, Nitto Boseki Co., Clariant, BASF and EKA Chemicals.

10 Other useful cationic compounds include DADMAC copolymers such as copolymers with acrylamide, e.g. NALCO 1470 trade mark of ONDEO Nalco or PAS-J-81, trademark of Nitto Boseki Co., such as copolymers of DADMAC with acrylates, such as Nalco 8190, trademark of ONDEO Nalco; copolymers of DADMAC with SO<sub>2</sub>, such as PAS-A-1 or PAS-92, trademarks  
15 of Nitto Boseki Co., copolymer of DADMAC with maleic acid, e.g. PAS-410, trademark of Nitto Boseki Co., copolymer of DADMAC with diallyl(3-chloro-2-hydroxypropyl)amine hydrochloride, eg. PAS-880, trademark of Nitto Boseki Co., dimethylamine-epichlorohydrine copolymers, e.g. Nalco 7135, trademark of ONDEO Nalco or POLYFIX  
20 700, trade name of Showa High Polymer Co.; other POLYFIX grades which could be used are POLYFIX 601, POLYFIX 301, POLYFIX 301A, POLYFIX 250WS, and POLYFIX 3000 ; NEOFIX E-117, trade name of Nicca Chemical Co., a polyoxyalkylene polyamine dicyanodiamine, and REDIFLOC 4150, trade name of EKA Chemicals, a polyamine; MADAME  
25 (methacrylatedimethylaminoethyl = dimethylaminoethyl methacrylate) or MADQUAT (methacryloxyethyltrimethylammonium chloride) modified polymers, e.g. ROHAGIT KL280, ROHAGIT 210, ROHAGIT SL144, PLEX 4739L, PLEX 3073 from Röhm, DIAFLOC KP155 and other DIAFLOC products from Diafloc Co., and BMB 1305 and other BMB products from EKA  
30 chemicals; cationic epichlorohydrin adducts such as POLYCUP 171 and POLYCUP 172, trade names from Hercules Co.; from Cytec industries : CYPRO products, e.g. CYPRO 514/515/516, SUPERFLOC 507/521/567; cationic acrylic polymers, such as ALCOSTAT 567, trademark of CIBA, cationic cellulose derivatives such as CELQUAT L-200, H-100, SC-  
35 240C, SC-230M, trade names of Starch & Chemical Co., and QUATRISOFT

- 20 -

LM200, UCARE polymers JR125, JR400, LR400, JR30M, LR30M and UCARE polymer LK; fixing agents from Chukyo Europe: PALSET JK-512, PALSET JK512L, PALSET JK-182, PALSET JK-220, WSC-173, WSC-173L, PALSET JK-320, PALSET JK-320L and PALSET JK-350; polyethyleneimine and  
5 copolymers, e.g. LUPASOL, trade name of BASF AG; triethanolamine-titanium-chelate, e.g. TYZOR, trade name of Du Pont Co.; copolymers of vinylpyrrolidone such as VIVIPRINT 111, trade name of ISP, a methacrylamido propyl dimethylamine copolymer; with  
dimethylaminoethylmethacrylate such as COPOLYMER 845 and COPOLYMER  
10 937, trade names of ISP; with vinylimidazole, e.g. LUVIQUAT CARE, LUVITEC 73W, LUVITEC VPI55 K18P, LUVITEC VP155 K72W, LUVIQUAT FC905, LUVIQUAT FC550, LUVIQUAT HM522, and SOKALAN HP56, all trade names of BASF AG; polyamidoamines, e.g. RETAMINOL and NADAVIN, trade marks of Bayer AG; phosphonium compounds such as disclosed in EP 609930 and  
15 other cationic polymers such as NEOFIX RD-5, trademark of Nicca Chemical Co.

The ink receiving layer(s), and an optional auxiliary layer, such as a backing layer for anti-curl purposes, or an extra protective  
20 layer, may further contain well-known conventional ingredients, such as surfactants serving as coating aids, hardening agents, plasticizers, whitening agents and matting agents.  
Surfactants may be incorporated in the layers of the recording material of the present invention. They can be any of the cationic,  
25 anionic, amphoteric, and non-ionic ones as described in JP-A 62-280068 (1987). Examples of the surfactants are N-alkylamino acid salts, alkylether carboxylic acid salts, acylated peptides, alkylsulfonic acid salts, alkylbenzene and alkyl-naphthalene sulfonic acid salts, sulfosuccinic acid salts,  $\alpha$ -olefin sulfonic acid salts,  
30 N-acylsulfonic acid salts, sulfonated oils, alkylsulfonic acid salts, alkylether sulfonic acid salts, alkylallylethersulfonic acid salts, alkylamidesulfonic acid salts, alkylphosphoric acid salts, alkyletherphosphoric acid salts, alkylallyletherphosphoric acid salts, alkyl and alkylallylpolyoxyethylene ethers,  
35 alkylallylformaldehyde condensed acid salts, alkylallylethersulfonic acid salts, alkylamidesulfonic acid salts, alkylphosphoric acid

- 21 -

salts, alkyletherphosphoric acid salts, alkylallyletherphosphoric acid salts, alkyl and alkylallylpolyoxyethylene ethers, alkylallylformaldehyde condensed polyoxyethylene ethers, blocked polymers having polyoxypropylene, polyoxyethylene

5 polyoxypropylalkylethers, polyoxyethyleneether of glycolesters, polyoxyethyleneether of sorbitanesters, polyoxyethyleneether of sorbitolesters, polyethyleneglycol aliphatic acid esters, glycerol esters, sorbitane esters, propyleneglycol esters, sugaresters, fluoro C<sub>2</sub>-C<sub>10</sub> alkylcarboxylic acids, disodium N-perfluorooctanesul-

10 fonyl glutamate, sodium 3-(fluoro-C<sub>6</sub>-C<sub>11</sub>-alkyloxy)-1-C<sub>3</sub>-C<sub>4</sub> alkyl sulfonates, sodium 3-(ω-fluoro-C<sub>6</sub>-C<sub>8</sub>-alkanoyl-N-ethylamino)-1-propane sulfonates, N-[3-(perfluorooctanesulfonamide)-propyl]-N,N-dimethyl-N-carboxymethylene ammonium betaine, fluoro-C<sub>11</sub>-C<sub>20</sub> alkylcarboxylic

15 acids, perfluoro-C<sub>7</sub>-C<sub>13</sub>-alkyl-carboxylic acids, perfluorooctane sulfonic acid diethanolamide, Li, K and Na perfluoro-C<sub>4</sub>-C<sub>12</sub>-alkyl sulfonates, N-propyl-N-(2-hydroxyethyl)perfluorooctane sulfonamide, perfluoro-C<sub>6</sub>-C<sub>10</sub>-alkylsulfonamide-propyl-sulfonyl-glycinates, bis-(N-perfluorooctylsulfonyl-N-ethanolaminoethyl)phosphonate,

20 mono-perfluoro C<sub>6</sub>-C<sub>16</sub> alkyl-ethyl phosphonates, and perfluoroalkylbetaine.

Useful cationic surfactants include N-alkyl dimethyl ammonium chloride, palmityl trimethyl ammonium chloride, dodecyldimethylamine, tetradecyldimethylamine, ethoxylated alkyl

25 guanidine-amine complex, oleamine hydroxypropyl bistrimonium chloride, oleyl imidazoline, stearyl imidazoline, cocamine acetate, palmitamine, dihydroxyethylcocamine, cocotrimonium chloride, alkyl polyglycolether ammonium sulphate, ethoxylated oleamine, lauryl pyridinium chloride, N-oleyl-1,3-diaminopropane, stearamidopropyl

30 dimethylamine lactate, coconut fatty amide, oleyl hydroxyethyl imidazoline, isostearyl ethylimidonium ethosulphate, lauramidopropyl

- 22 -

PEG-dimoniumchloride phosphate, palmityl trimethylammonium chloride, and cetyltrimethylammonium bromide.

Especially useful are the fluorocarbon surfactants as described in e.g. US-P 4,781,985, having a structure of :

5  $F(CF_2)_{4-9}CH_2CH_2SCH_2CH_2N^+R_3X^-$  wherein R is a hydrogen or an alkyl group; and in US-P 5,084,340, having a structure of:

$CF_3(CF_2)_mCH_2CH_2O(CH_2CH_2O)_nR$  wherein  $m = 2$  to 10;  $n = 1$  to 18; R is hydrogen or an alkyl group of 1 to 10 carbon atoms. These

surfactants are commercially available from DuPont and 3M. The  
10 concentration of the surfactant component in the ink-receiving layer is typically in the range of 0.1 to 2 %, preferably in the range of 0.4 to 1.5 % and is most preferably 0.75 % by weight based on the total dry weight of the layer.

15 As explained above the preferred crosslinking agent (or hardener) incorporated in the ink receiving layer(s) and/or in an auxiliary layer is boric acid. However another hardener which is able to crosslink the polymer of the invention may be used, or an additional hardener beside boric acid may be used. There are a vast number of  
20 known crosslinking agents that will function to crosslink film forming binders, including formaldehyde and free dialdehydes, such as succinaldehyde and glutaraldehyde, blocked dialdehydes, active esters, sulfonate esters, active halogen compounds, isocyanate or blocked isocyanates, polyfunctional isocyanates, melamine  
25 derivatives, s-triazines and diazines, epoxides, active olefins having two or more active bonds, carbodiimides, zirconium complexes, e.g. BACOTE 20, ZIRMEL 1000 or zirconium acetate, trademarks of MEL Chemicals, titanium complexes, such as TYZOR grades from DuPont, isoxazolium salts substituted in the 3-position, esters of  
30 2-alkoxy-N-carboxy-dihydroquinoline, N-carbamoylpyridinium salts, hardeners of mixed function, such as halogen-substituted aldehyde acids (e.g. mucochloric and mucobromic acids), onium substituted acroleins and vinyl sulfones and polymeric hardeners, such as dialdehyde starches and copoly(acroleinmethacrylic acid), and

- 23 -

oxazoline functional polymers, e.g. EPOCROS WS-500, and EPOCROS K-1000 series, and maleic anhydride copolymers, e.g. GANTREZ AN119. However, as explained above, for the practice of this invention boric acid is the preferred crosslinker.

5

The ink-receiving layer and the optional auxiliary layer(s) may also comprise a plasticizer such as ethylene glycol, diethylene glycol, propylene glycol, polyethylene glycol, glycerol monomethylether, glycerol monochlorohydrin, ethylene carbonate, propylene carbonate, urea phosphate, triphenylphosphate, glycerolmonostearate, propylene glycol monostearate, tetramethylene sulfone, n-methyl-2-pyrrolidone, n-vinyl-2-pyrrolidone.

10

The different layers can be coated onto support by any conventional coating technique, such as dip coating, knife coating, extrusion coating, spin coating, slide hopper coating and curtain coating.

15

The present invention will now be illustrated by the following examples without however being limited thereto.

20

## EXAMPLES

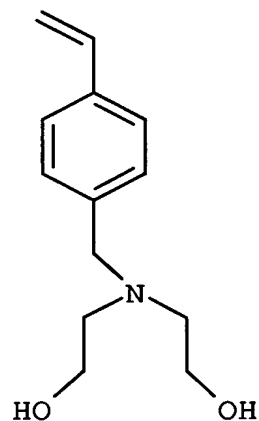

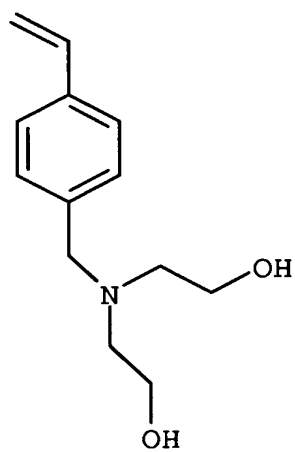

### Example 1

25 Example of polymer synthesis.

30

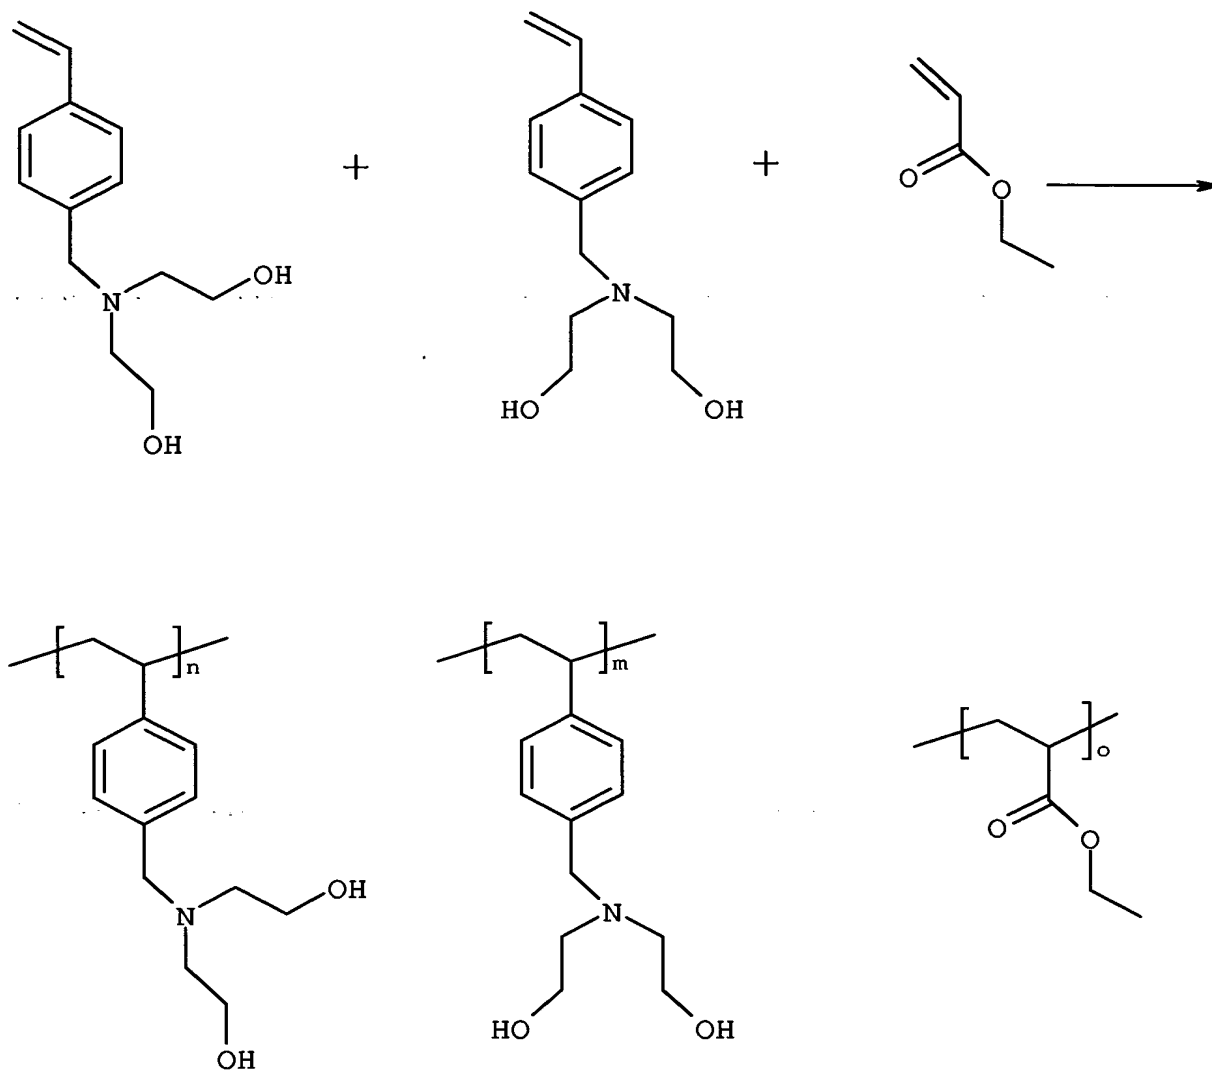

Monomer I - 1 of table 1: Isomeric mixture of 2-[(2-hydroxy ethyl)-(4-vinyl phenyl)-amino] ethanol (or 2,2'-[[ (4-ethenylphenyl)methyl]imino]bis ethanol = CASRN58436-69-4) and 2-[(2-hydroxy ethyl)-(3-vinyl phenyl)-amino] ethanol (or 2,2'-[[ (3-ethenylphenyl)methyl]imino]bis ethanol):

- 24 -

- 25 -

Synthesis of Polymer 1: i.e. water based emulsion copolymer based on a copolymer of ethylacrylate and monomer I - 1.

5

Polymer 1 was prepared via a semi-continuous emulsion polymerization. 11.13 g of cetyldimethyl benzyl ammonium chloride was dissolved in 1269 g of water in a 2 liter jacketed reactor with nitrogen flow and stirred at 250 rpm. Subsequently the reactor was heated to 85 °C. When the reactor reached 85 °C 252 g of ethyl acrylate and 108 g of monomer I - 1 was added to the reactor. The emulsion was stirred for 5 minutes. Subsequently the reaction was initiated by addition of 13,5 g of a 2% aqueous solution of 2,2'-

- 26 -

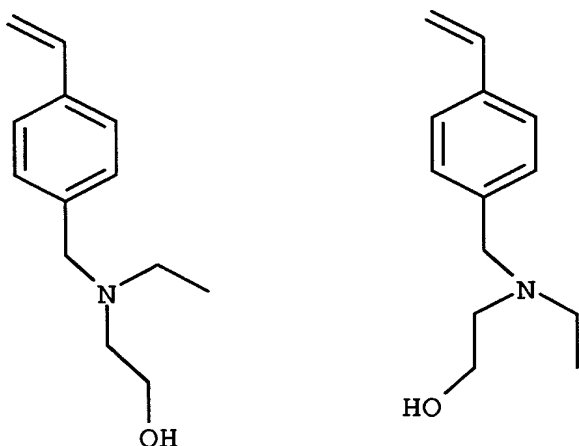

azobis(2-amidinopropane) dihydrochloride (WAKO V50). After nucleation of the latex a monomer mixture composed of 214,2 g ethylacrylate and 91,8 g of monomer I - 1 was added during 90 minutes. Simultaneously, 76,5 g of a 2% aqueous solution of 2,2'-  
5 azobis(2-amidinopropane) dihydrochloride (WAKO V50) was dosed in 110 minutes. When all ingredients were added to the reactor the reaction was allowed to continue for 30 minutes. Subsequently a post-initiation was done by adding simultaneously 19,59 g of a 5% hydrogen peroxide and 50,74 g of a 10 wt% aqueous ascorbic acid  
10 solution during 5 minutes. After an additional hour of reaction, the residual monomer was removed by vacuum distillation during 1 hour. The latex was cooled to room temperature and subsequently the latex was filtered over coarse filtration paper. The emulsion polymerization resulted in a latex having an average particle size  
15 of 84 nm, a pH of 6.3, a viscosity of 4,3 mPa.s and a solids content of 19.6 weight %.

### Example 2

Example of polymer synthesis

20

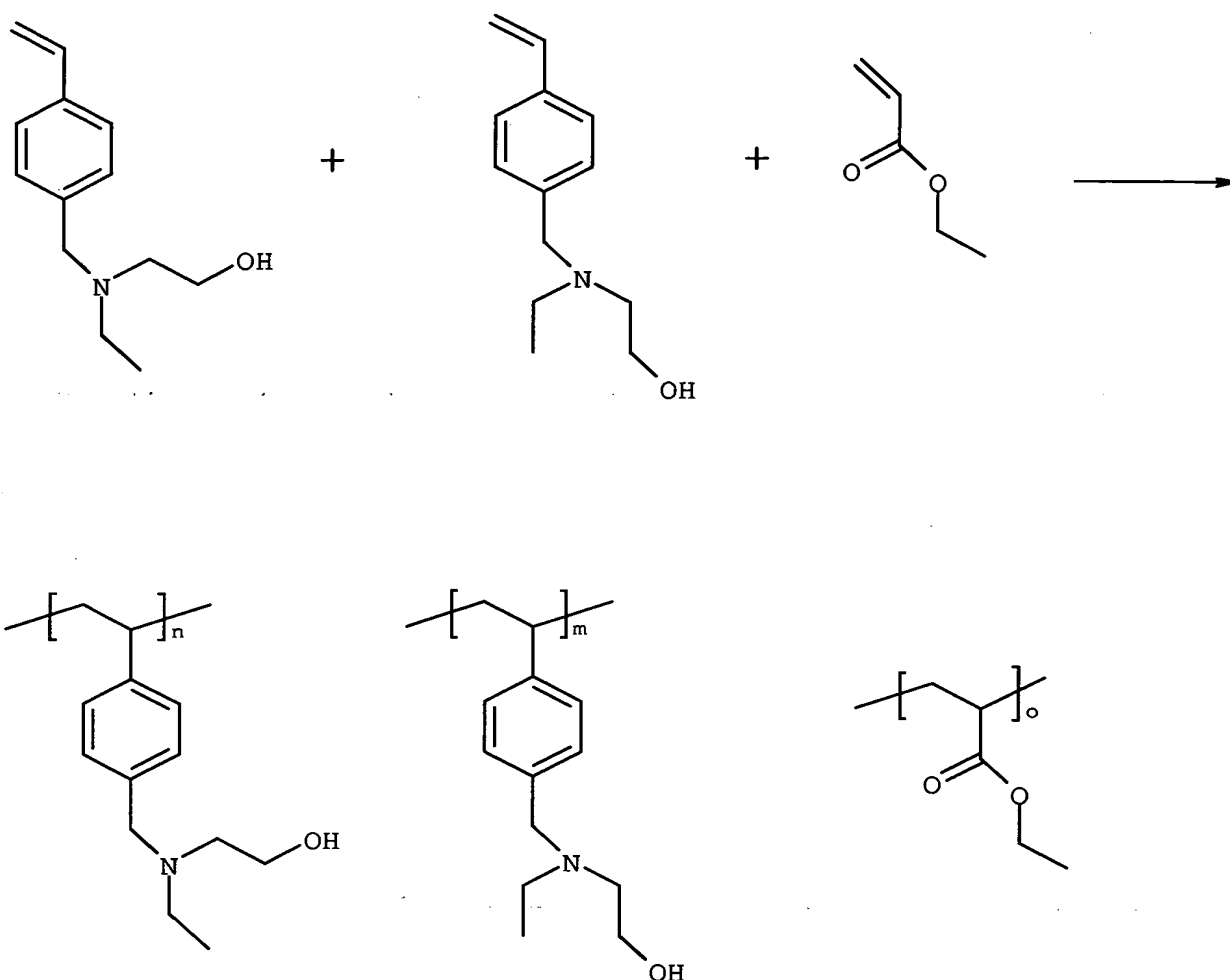

Monomer I - 3 of table 1: Isomeric mixture of 2-[ethyl-(3-vinyl phenyl)-amino] ethanol and 2-[ethyl-(4-vinyl phenyl)-amino] ethanol:

25

Synthesis of Polymer 2: i.e. water based emulsion copolymer based on a copolymer of ethylacrylate and monomer I - 3.

- 27 -

Polymer 2 was prepared via a semi-continuous emulsion polymerization. 1.55 g of cetyldimethyl benzyl ammonium chloride was dissolved in 172 g of water in a 500 ml jacketed reactor with nitrogen flow and stirred at 250 rpm. Subsequently the reactor was heated to 85 °C. When the reactor reached 85 °C, 5.25 grams of ethylacrylate and 2.25 grams of monomer I - 3 was added to the reactor. The emulsion was stirred for 5 minutes. Subsequently the reaction was initiated by addition of 1.88 gram of a 2% aqueous solution of 2,2'-azobis(2-amidinopropane) dihydrochloride (WAKO V50). After nucleation of the latex a monomer mixture composed of 29.75 gram of ethyl acrylate and 12.75 grams of monomer I - 3 was added during 90 minutes. Simultaneously, 10.63 grams of a 2% aqueous solution of 2,2'-azobis(2-amidinopropane) dihydrochloride (WAKO V50)

- 28 -

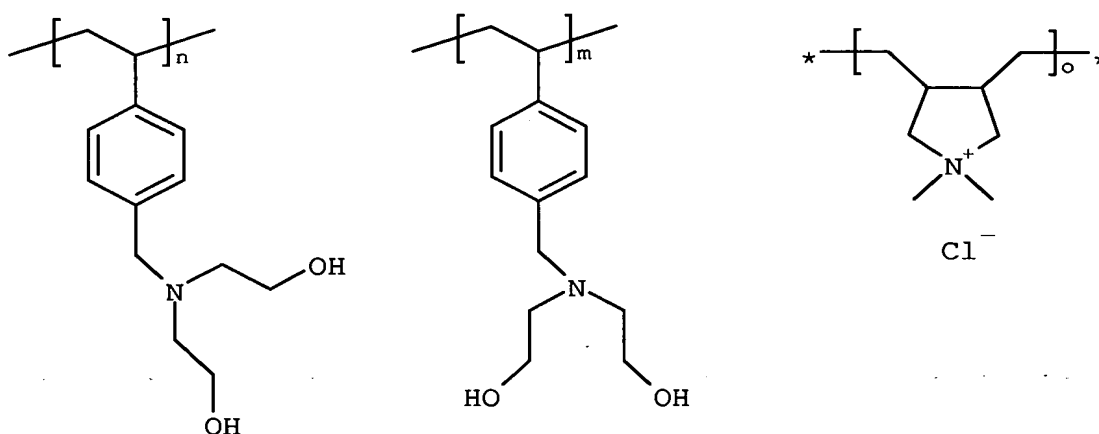

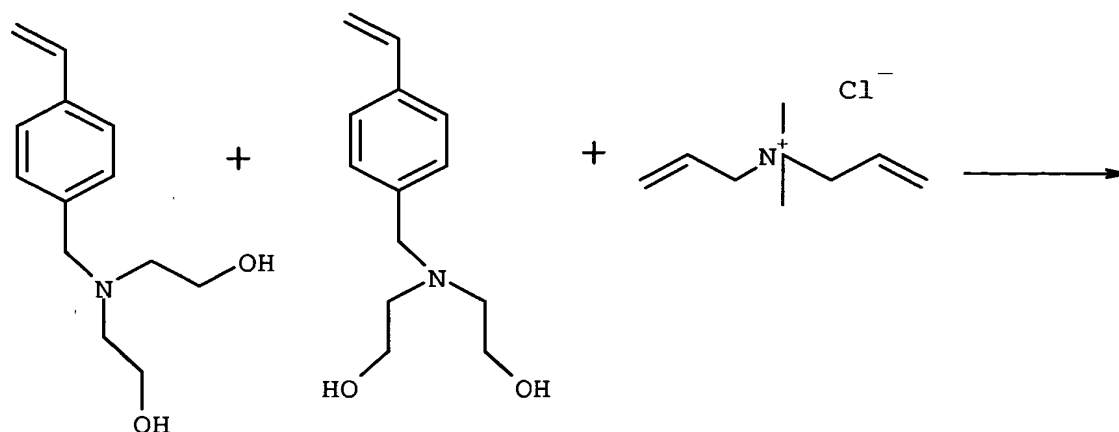

was dosed in 110 minutes. When all ingredients were added to the reactor the reaction was allowed to continue for 30 minutes. Subsequently a post-initiation was done by adding simultaneously 7.05 gram of a 5% hydrogen peroxide and 7.05 gram of a 10 wt% aqueous ascorbic acid solution during 5 minutes. After an additional hour of reaction, the residual monomer was removed by vacuum distillation during 1 hour. The latex was cooled to room temperature and subsequently the latex was filtered over coarse filtration paper. The emulsion polymerization resulted in a latex having an average particle size of 474 nm, a pH of 6.6, a viscosity of 5.6 mPa.s and a solids content of 19.2 weight %.

### Example 3

Example of polymer synthesis

Synthesis of Polymer 3: i.e. water-soluble copolymer based on a copolymer of diallyldimethylammonium chloride (DADMAC) and monomer I - 1.

- 29 -

691 g of a 65 wt% aqueous solution of diallyldimethylammonium chloride and 30.85 gram of monomer I - 1 were dissolved in water in a 2 l jacketed reactor with nitrogen flow and stirred at 250 rpm. The reactor was heated to 60 °C and 48 g of a 10 weight % aqueous solution of 2,2'-azobis(2-amidinopropane) dihydrochloride (WAKO V50) was added during 6 hours. Subsequently the reaction temperature was raised to 70 °C and 24 g of a 10% aqueous solution of WAKO V50 was added during 3 hours. After 16 hours of reaction time the reaction mixture was cooled to room temperature and an emulsion was obtained having a pH of approx. 8.1. The pH was reduced to pH 4.56 by addition of 35 g of a 4N aqueous solution of hydrogen chloride. The solids content of the obtained aqueous solution was 31.7 weight%.

- 30 -

Example 4

Example of evaluation in an ink jet recording material

Preparation of the coating solutions

5

Comparative sample : a coating liquid for forming an ink recording layer was prepared by adding 30 parts by solid weight of a 40% aqueous solution of alumina (CAB-O-SPERSE PG003 provided by Cabot Corp.) together with 1.5 parts by weight of a 4% aqueous solution of boric acid to 6.0 parts by weight of a 10% aqueous solution of polyvinyl alcohol (GOSHEFIMER K210 provided by Nippon Goshei).

10

Invention sample : same procedure as for the comparative sample with the exception that in the preparation of the coating liquid for the ink receiving layer, the polyvinyl alcohol was replaced by 15.0 parts by weight of a 20% aqueous latex dispersion corresponding to Polymer 1 and the amount of boric acid was increased to 7.5 parts by weight.

15

Coating and evaluation of the coated samples

20

The two coating solutions were coated on a subbed PET sheet (100  $\mu\text{m}$ ) using a blade coater to form an ink receiving layer having a dry weight of 31.5 g/m<sup>2</sup>, and dried at 40°C. The cracking of the coating was visually evaluated.

25

Color patches containing primary and secondary colors were printed on the coated samples by means of a EPSON STYLUS Photo 870 ink jet printer (trademark of Seiko Epson Corp.). By means of these color patches the intercolor bleeding, image irregularity and the drying speed can be evaluated. The drying speed is evaluated by rubbing the primary colors and the secondary colors with the finger immediately (within 5 seconds) after printing. When no smearing of the colors is observed, the recording media is called instant dry. The image irregularity was visually observed in the green solid colors (yellow + cyan). The color bleeding was rated 1 to 5 on a qualitative arbitrary scale with 5 being best without any color bleeding. The test results are shown in table 3.

30

35

- 31 -

TABLE 3

Sample	Cracking	Instant dry for primary colors	Instant dry for secondary colors	Bleeding	Irregularity in solid green
Comp. Ex 4	No	Yes	No	2	Yes
Inv. Ex 4	No	Yes	No	4	No

5 As can be seen, the coated and printed invention sample described in this example 4 with a much higher binder (Polymer 1) concentration compared to the comparative example, shows a higher image quality without imparting negatively the physical properties as drying time and cracking.

10

#### Example 5

Example of evaluation in an ink jet recording material

15 An ink jet recording medium was produced by the same procedures as in Example 4 with the exception that in the preparation of the coating liquid for the ink receiving layer, the inorganic pigment was replaced by 30 parts by solid weight of a 40% aqueous solution of silica (AERODISP W340 provided by Degussa Corp.) together with 2.0 parts by weight of commercial pseudo-boehmite DISPERAL P3, trade  
20 name of Sasol Co., 15 % dispersion in water. The concentration of the binder was decreased to 6.6 parts by weight of the 20% aqueous latex dispersion corresponding with Polymer 1 and the amount of boric acid was decreased to 6.6 parts by weight of a 4% aqueous solution. The comparative sample of example 2 was obtained by using  
25 6.0 parts by weight of a 10% aqueous solution of polyvinyl alcohol (GOSHEFIMER K210 provided by Nippon Goshei) instead of Polymer 1 as binder.

The samples were coated and printed in the same way as in example 1.

30 The results are shown in table 4.

- 32 -

TABLE 4

Sample	Cracking	Instant dry for primary colors	Instant dry for secondary colors	Irregularity in solid green
Comp. Ex. 5	Yes	Yes	No	Yes
Inv Ex. 5	No	Yes	No	No

- 5 As can be seen, the coated and printed sample described in this example 5 with Polymer 1 as binder shows better image quality, physical properties for the same ink drying time than the samples coated in the comparative example with polyvinyl alcohol as binder.
- 10 Having described in detail preferred embodiments of the current invention, it will now be apparent to those skilled in the art that numerous modifications can be made therein without departing from the scope of the invention as defined in the appending claims.

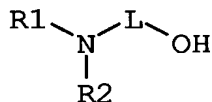

**THIS PAGE BLANK (USPTO)**

- 33 -

**[CLAIMS]**

1. An ink jet recording material comprising a support and at least one ink receiving layer containing a water-soluble or water-dispersible polymer, characterized in that said polymer comprises a repeating monomeric unit having a moiety capable of chelating boric acid by means of at least one nitrogen containing functional group and at least one hydroxyl group thereby forming a five- or six-membered ring.

2. An ink jet recording material according to claim 1 wherein said monomeric unit is represented by following general formula (I):

(I)

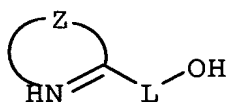

wherein,

R1 and R2 are selected from the group consisting of hydrogen, a substituted or unsubstituted, saturated or unsaturated aliphatic group, a substituted or unsubstituted aryl group, and a substituted or unsubstituted heteroaryl group;

L represents a linking group containing two or three carbon atoms which may be further substituted or may be part of a ring;

any of L, R1 and R2 may combine to form a ring, and at least one of L, R1 and R2 comprises an ethylenically unsaturated polymerizable group.

3. An ink jet recording material according to claim 1 wherein said monomeric unit is represented by following general formula (II) :

(II)

- 34 -

wherein,

Z represents the necessary atoms to form a substituted or unsubstituted five- or six-membered heteroring;

5 L represents a linking group containing one or two carbon atoms which may be further substituted or may be part of a ring, and at least one of the heteroring or L comprises an ethylenically unsaturated polymerizable group.

4. An ink jet recording material according to claim 2 or 3 wherein  
10 any of L, R1 and R2 is substituted by one or more groups comprising one or more additional hydroxyl groups.
5. An ink jet recording material according to any of claims 1 to 4 wherein said polymer comprises at least one other repeating monomeric unit chosen from the list consisting of vinyl acetate, vinyl alcohol, dimethylaminoethyl methacrylate, vinyl amine,  
15 vinyl formamide, vinylacetamide, diallyl amine, vinyl versatate, butyral acrylate, styrene, dimethylaminoethyl acrylate, methacryloxyethyltrimethyl ammonium chloirde, ethylacrylate, butylmethacrylate, styrene, methyl methacrylate, butyl acrylate, 2-ethylhexyl methacrylate, vinyl amine, diallyldimethyl ammonium  
20 chloride, 2-ethylhexyl acrylate, methacryloxyethyldimethyl benzyl ammonium choride, acryloxyethyldimethyl benzyl ammonium choride, vinyl caprolactam and vinyl pyrrodidone.
6. An ink jet recording material according to any of claims 1 to 5 wherein said polymer is a latex.
- 25 7. An ink jet recording material according to any of claims 1 to 6 wherein said polymer functions as binder.
8. An ink jet recording material according to any of claims 1 to 7 wherein said ink receiving layer further comprises a pigment.
9. An ink jet recording material according to claim 8 wherein said  
30 pigment is an inorganic pigment.

- 35 -

10. An ink jet recording material according to claim 9 wherein  
inorganic pigment is chosen from the group consisting of aluminum  
oxide, boehmite, pseudo-boehmite, gibbsite, bayerite, aluminum  
hydroxide, silica, clay, calcium carbonate, zirconia, and mixed  
5 inorganic oxides/hydroxides.
11. An ink jet recording material according to any of claims 1 to 10  
wherein said ink receiving layer further contains a hardener.
12. An ink jet recording material according to claim 11 wherein said  
hardener is boric acid.
